During the Internet boom of the 1990's and early 2000's, Universities and Colleges built large Internet Service Providers and Education Centers where students were taught to design websites. The younger generation in our country did not receive formal education about Intellectual Property and how to use it. Most of the time, the student did not know how to distinguish what was protected by copyright from what was not. I was part of this generation of students and I was also a student when this boom was over. When the boom was over, I had student internships. What I learned in those internships is that Business students wanted to know how to market their programs. Engineering students wanted to know how to build their programs. Computer science students wanted to know how to design their programs. In each of these, there were people who had limited the number of projects they could use. For example, a Business major wanted to build a website but they only had one page. All they needed was an image. They did not need to be able to draw on that image with a computer mouse. So, the Business major did not have the right to use copyrighted images to draw on. In the end, that Business major was limited by the rights of other people. What happens when Copyright or Patent law is interpreted by the Courts to mean the 'sole Right' of the owner? In the end, many students turned down many good internship opportunities because they feared a conflict of interest with their partners at their University. Now, there are more things you can do with Copyright and Patent law. There are ethics that you must consider about each time you use copyrighted and patented material. There are also legal and ethical reasons why you should avoid the use of copyrighted and patented material if you are a student. Ethics Beyond High School - Academic Ethics and Internet Use Any copyrighted material, including the text, images, audio and video can be used for academic purposes if you are properly credited and if you obtain permission to use copyrighted material. This includes, but is not limited to, books, journal articles, conferences, websites, etc. If you use copyrighted material you must:

- o Ensure you properly attribute the material.
- o Make sure you properly secure your copy of the copyrighted material.
- o If possible, have your instructor read and approve the use of the material.
- o If possible, have your instructor agree to the Terms and Conditions of your use of copyrighted material. If you use patented material, your instructor should be able to refer you to the US Patent 77a5ca646e

FileCHK is an open source utility designed to be an all-in-one tool for cleaning up damaged files. It can be considered a back-up to your usual file recovery tools and a replacement for some of the built-in system tools which can not be relied upon to find all corrupted files. FileCHK is capable of recovering data that is stored as fragmented files and converted to the system registry. It can also find and recover data that is stored in a variety of files, including Office documents, pictures, movies and music. The utility can be used in two ways: the first and simplest method is to open the utility and start scanning and checking disk. Another method is to scan a particular disk and then to select the files and folders that you want to recover and then click the 'Recover Files' button. In order to make the utility work, you must copy it to the same directory where the CHK files are located. Further, make sure that the files are all of the same extension as the ones the utility was developed for. Also, make sure that you have Winzip or WinRAR in order to extract the software from the archive which it is stored in. Finally, remember that when you are using the utility, you should follow the operating system's instructions when they appear. Features: The main feature of FileCHK is that it is capable of detecting fragments of data that have been stored in files. Data stored in the registry is also detected but FileCHK is not capable of extracting this data. This feature is based on a proven algorithm that can identify data that has been stored in files as fragments. Fragment files can be located using the standard Windows searching functionality which is included in the operating system. Depending on the application of the file being searched, FileCHK can detect files that are on an individual partition, files on a system partition, and files that are located in a disk volume. All of the files that are scanned and analyzed are contained in a single file. When the utility is in the process of scanning a file, a progress bar shows the percentage of data that has been identified. When the scanning is completed, a list of all the recovered files will be displayed along with the size of each file, its type, the name of the file and the current state of the file. Recovering files from a damaged partition, system partition or a disk volume can be done by clicking the 'Recover Files' button. This
